

# What to Expect

## During Construction

- The majority of the new transmission line will be constructed in an existing Duke Energy transmission corridor.
- In most cases, existing structures will be rebuilt close to their current locations to hold the existing line and the new line
- In some areas, new structures will be placed in new easements adjacent to the existing transmission line.
- Large equipment will be used, including cranes and cement trucks.
- Work zones will be established using flaggers, traffic cones, and signage to help ensure safety for both the public and workers.
